HyperText Markup Language 5

By Anthony M.

Introduction

1. What is HTML?

HTML (*HyperText Markup Language*) is the standard language used to create and structure content on the web. It forms the foundation of most websites and defines the meaning and structure of web content.

2. Setting Up Your Environment

a. Simple Introduction to Code Editors.

A **code editor** is a tool used to write, edit, and manage code for various programming and development tasks.

b. Deciding on your Code Editor

Choosing the right **code editor** is an important step when starting web development or programming.

Please be aware that we will be using [Virtual Studio Code](#) (VSCode). There are many other options available, but exploring those will be up to you.

3. Your First HTML Page

a. File Extension

The **HTML** (*HyperText Markup Language*) file extension is **.html**.

b. Project Structure (View)

```
📁 project
└─ index.html
```

Explanation:

1. 📁 **project**: Represents the project folder.
2. └─ **index.html**: Represents the index.html file inside the project folder.
